The Lust of Seeing, which is the first book in English on Hernandez, is the product of four years of research and writing. Extended work in archival sources during a 1991 Fulbright residency in Montevideo, Uruguay, were complemented by constant, careful reading of Hernandez's fictions and by research in a vast interdisciplinary body of secondary literature. Works of theory, anthropology, psychoanalysis, and clinical psychology reinforce Frank Graziano's perceptive reading of Hernandez. His methodologically innovative exploration of themes such as narcissism, the mirror, projection, the double, ritualized sexuality, fragmentation, erotic and aggressive uses of the eye, Pygmalion poetics, and the maternal body situates Hernandez's fictions in the broad cultural context that affords them their most resonant meaning. The Lust of Seeing is the most comprehensive work on Hernandez to date, elucidating aspects of Hernandez's life and writing that have remained untreated or undertreated by previous criticism. The book's theoretical and comparative discussions also make The Lust of Seeing relevant reading well beyond Hernandez studies, particularly for readers interested in psychoanalysis, myth and ritual, fantastic literature, women's studies, film studies, and textual theory.

Arousal in Neurological and Psychiatric Diseases focuses on the dysregulation of arousal found in many neurological and psychiatric disorders. Chapters describe the physiology of each process, how it presents in each disorder, and the most appropriate treatment(s). The book also imparts the understanding of the RAS as a system that not only modulates waking, but also survival mechanisms, such as fight vs. flight responses and other reflexes. This book helps neuroscientists, sleep researchers, neurologists and psychiatrists understand the basic mechanisms that modulate arousal in health and disease. In addition, it promotes therapies that can alter the severity and manifestation of multiple disorders. Provides a comprehensive overview of the basic mechanisms behind dysregulation of arousal in neurological and psychiatric disorders Describes, in detail, the function of the Reticular Activating System with respect to higher functions, motor control and the intertwining of arousal and motor disorders Covers multiple neurological disorders, including epilepsy, Alzheimer's disease, Parkinson's disease and autism

Schizophrenia, which starts in middle age or late life, has been described as 'the darkest area of psychiatry.' It is certainly controversial, with much disagreement about cut-off ages, diagnostic criteria and nomenclature. The contributors to this unique and very important book represent views from Europe and North America as well as Australia, Japan, and Nepal; they come from backgrounds of clinical practice and research. The contributors and editors were motivated by common aims: to review current international knowledge about late onset schizophrenia, to debate issues of heterogeneity, gender, brain maturation and aging, putative structural and functional cerebral substrates for psychosis, to reach consensus on diagnosis and terminology, and to future research directions. The resulting book is an unqualified success which as well as being invaluable in old age psychiatry, sheds light on all aspects of schizophrenia treatment and research.

Fundamentals of Social Work Research is a briefer, but thoroughly re-worked version of the Engel and Schutt's The Practice of Research in Social Work 2e which will provide an engaging text for introductory social work research classes. The Practice of Research in Social Work introduced research methods as an integrated set of techniques to investigate social work practice methods and problems. The brief edition will continue to integrate substantive practice-related examples with research techniques, present ethical decision making as a part of every aspect of the research design process, and infuse content on diversity and populations at risk throughout the text. The format is appropriate for courses in social work research methods which are one quarter or one semester in length.

From the Nobel Prize-winning author of *Thinking, Fast and Slow* and the coauthor of *Nudge*, a revolutionary exploration of why people make bad judgments and how to make better ones--"a tour de force" (New York Times). Imagine that two doctors in the same city give different diagnoses to identical patients or that two judges in the same courthouse give markedly different sentences to people who have committed the same crime. Suppose that different interviewers at the same firm make different decisions about indistinguishable job applicants or that when a company is handling customer complaints, the resolution depends on who happens to answer the phone. Now imagine that the same doctor, the same judge, the same interviewer, or the same customer service agent makes different decisions depending on whether it is morning or afternoon, or Monday rather than Wednesday. These are examples of noise: variability in judgments that should be identical. In *Noise*, Daniel Kahneman, Olivier Sibony, and Cass R. Sunstein show the detrimental effects of noise in many fields, including medicine, law, economic forecasting, forensic science, bail, child protection, strategy, performance reviews, and personnel selection. Wherever there is judgment, there is noise. Yet, most of the time, individuals and organizations alike are unaware of it. They neglect noise. With a few simple remedies, people can reduce both noise and bias, and so make far better decisions. Packed with original ideas, and offering the same kinds of research-based insights that made *Thinking, Fast and Slow* and *Nudge* groundbreaking New York Times bestsellers, *Noise* explains how and why humans are so susceptible to noise in judgment and what we can do about it.

What is autism and where has it come from? Increased diagnostic rates, the rise of the 'neurodiversity' movement, and growing autism journalism, have recently fuelled autism's fame and controversy. The metamorphosis of autism is the first book to explain our current fascination with autism by linking it to a longer history of childhood development. Drawing from a staggering array of primary sources, Bonnie Evans traces autism back to its origins in the early twentieth century and explains why the idea of autism has always been controversial and why it experienced a 'metamorphosis' in the 1960s and 1970s. Evans takes the reader on a journey of discovery from the ill-managed wards of 'mental deficiency' hospitals, to high-powered debates in the houses of parliament, and beyond. The book will appeal to a wide market of scholars and others interested in autism.

#1 NEW YORK TIMES BESTSELLER ■ OPRAH'S BOOK CLUB PICK The heartrending story of a midcentury American family with twelve children, six of them diagnosed with schizophrenia, that became science's great hope in the quest to understand the disease. "Reads like a medical detective journey and sheds light on a topic so many of us face: mental illness." ■ Oprah Winfrey Don and Mimi Galvin seemed to be living the American dream. After World War II, Don's work with the Air Force brought them to Colorado, where their twelve children perfectly spanned the baby boom: the oldest born in 1945, the youngest in 1965. In those years, there was an established script for a family like the Galvins--aspiration, hard work, upward mobility, domestic harmony--and they worked hard to play their parts. But behind the scenes was a different story: psychological breakdown, sudden shocking violence, hidden abuse. By the mid-1970s, six of the ten Galvin boys, one after another, were diagnosed as schizophrenic. How could all this happen to one family? What took place inside the house on Hidden Valley Road was so extraordinary that the Galvins became one of the first families to be studied by the National Institute of Mental Health. Their story offers a shadow history of the science of schizophrenia, from the era of institutionalization, lobotomy, and the schizophrenogenic mother to the search for genetic markers for the disease, always amid profound disagreements about the nature of the illness itself. And unbeknownst to the Galvins, samples of their DNA informed decades of genetic research that continues today, offering paths to treatment, prediction, and even eradication of the disease for future generations. With clarity and compassion, bestselling and award-winning author Robert Kolker uncovers one family's unforgettable legacy of suffering, love, and hope.

An urgent exposé of the mental health crisis in our courts, jails, and prisons America has made mental illness a crime. Jails in New York, Los Angeles, and Chicago each house more people with mental illnesses than any hospital. As many as half of all people in America's jails and prisons have a psychiatric disorder. One in four fatal police shootings involves a person with such disorders. In this revelatory book, journalist Alisa Roth goes deep inside the criminal justice system to show how and why it has become a warehouse where inmates are denied proper treatment, abused, and punished in ways that make them sicker. Through intimate stories of people in the system and those trying to fix it, Roth reveals the hidden forces behind this crisis and suggests how a fairer and more humane approach might look. Insane is a galvanizing wake-up call for criminal justice reformers and anyone concerned about the plight of our most vulnerable.

In a brilliant antidote to all the false narratives about pot (American Thinker), an award-winning author and former New York Times reporter reveals the link between teenage marijuana use and mental illness, and a hidden epidemic of violence caused by the drug facts the media have ignored as the United States rushes to legalize cannabis. Recreational marijuana is now legal in nine states. Advocates argue cannabis can help everyone from veterans to cancer sufferers. But legalization has been built on myths that marijuana arrests fill prisons; that most doctors want to use cannabis as medicine; that it can somehow stem the opiate epidemic; that it is beneficial for mental health. In this meticulously reported book, Alex Berenson, a former New York Times reporter, explodes those myths, explaining that almost no one is in prison for marijuana; a tiny fraction of doctors write most authorizations for medical marijuana, mostly for people who have

already used; and marijuana use is linked to opiate and cocaine use. Most of all, THC—the chemical in marijuana responsible for the drug’s high—can cause psychotic episodes. Alex Berenson has a reporter’s tenacity, a novelist’s imagination, and an outsider’s knack for asking intemperate questions (Malcolm Gladwell, The New Yorker), as he ranges from the London institute that is home to the scientists who helped prove the cannabis-psychosis link to the Colorado prison where a man now serves a thirty-year sentence after eating a THC-laced candy bar and killing his wife. He sticks to the facts, and they are devastating. With the US already gripped by one drug epidemic, Tell Your Children is a well-written treatise (Publishers Weekly) that takes a sledgehammer to the promised benefits of marijuana legalization, and cannabis enthusiasts are not going to like it one bit (Mother Jones).

Zimmerman breaks new ground in Poe studies by providing a catalogue of three hundred figures of speech and thought in the author’s oeuvre, including his tales, personal correspondence, literary criticism, book reviews, and marginalia. This incisive catalogue of literary and rhetorical terms, presented in alphabetical order and amply illustrated with examples - in addition to close examinations of some of Poe’s most important tales - overwhelmingly demonstrates Poe’s rhetorical and linguistic dexterity, putting a nearly two-hundred-year-old critical debate to rest by showing Poe to be a conscientious craftsman of the highest order.

A New York Times Editors Choice Selection A global sensation, Kim Jiyoung, Born 1982 has become a touchstone for a conversation around feminism and gender (Sarah Shin, Guardian). One of the most notable novels of the year, hailed by both critics and K-pop stars alike, Kim Jiyoung, Born 1982 follows one woman’s psychic deterioration in the face of rampant misogyny. In a tidy apartment on the outskirts of Seoul, millennial everywoman Kim Jiyoung spends her days caring for her infant daughter. But strange symptoms appear: Jiyoung begins to impersonate the voices of other women, dead and alive. As she plunges deeper into this psychosis, her concerned husband sends her to a psychiatrist. Jiyoung narrates her story to this doctor—from her birth to parents who expected a son to elementary school teachers who policed girls’ outfits to male coworkers who installed hidden cameras in women’s restrooms. But can her psychiatrist cure her, or even discover what truly ails her? A social treatise as well as a work of art (Alexandra Alter, New York Times), Kim Jiyoung, Born 1982 heralds the arrival of international powerhouse Cho Nam-Joo.

In his highly praised book The Nostalgia Factory, renowned memory scholar Douwe Draaisma explored the puzzling logic of memory in later life with humor and deep insight. In this compelling new book he turns to the miracle of forgetting. Far from being a defect that may indicate Alzheimer’s or another form of dementia, Draaisma claims, forgetting is one of memory’s crucial capacities. In fact, forgetting is essential. Weaving together an engaging array of literary, historical, and scientific sources, the author considers forgetting from every angle. He pierces false clichés and asks important questions: Is a forgotten memory lost forever? What makes a colleague remember an idea but forget that it was yours? Draaisma explores first memories of young children, how experiences are translated into memory, the controversies over repression and recovered memories, and weird examples of memory dysfunction. He movingly examines the impact on personal memories when a hidden truth comes to light. In a persuasive conclusion the author advocates the undervalued practice of the art of forgetting—a set of techniques that assist in erasing memories, thereby preserving valuable relationships and encouraging personal contentment.

The volume traces the scope and development of Caryl Churchill’s theatre from her early writing for radio and television, through her stage career of the 1970s and 1980s to her recent major success Far Away (2000). Making use of contemporary critical and feminist theory, the study offers close dramatic and theatrical readings of the plays highlighting Churchill’s concerns with feminism, socialism and theatrical style. A key chapter on ‘The Woman Writer’ examines those plays, including Cloud Nine and Top Girls, which brought Churchill to the attention of the international feminist theatre academy, and links Churchill’s emergent feminism to her personal struggle to combine a career in the theatre with motherhood. Detailing the international success of play such as Serious Money and Mad Forest, alongside some of the lesser known and lesser studied earlier work, this accessible account illustrates how Churchill has come to be recognised as one of the leading playwrights of our contemporary theatre.

This report provides an overview of the current state of knowledge about why some people hear voices, experience paranoia or have other experiences seen as ‘psychosis’. It also describes what can help. In clinical language, the report concerns the ‘causes and treatment of schizophrenia and other psychoses’. In recent years we have made huge progress in understanding the psychology of what had previously often been thought of as a largely biological problem, an illness. Much has been written about the biological aspects: this report aims to redress the balance by concentrating on the psychological and social aspects, both in terms of how we understand these experiences and also what can help when they become distressing. We hope that this report will contribute to a fundamental change that is already underway in how we as a society think about and offer help for ‘psychosis’ and ‘schizophrenia’. For example, we hope that in future services will no longer insist that service users accept one particular view of their problem, namely the traditional view that they have an illness which needs to be treated primarily by medication. The report is intended as a resource for people who work in mental health services, people who use them and their friends and relatives, to help ensure that their conversations are as well informed and as useful as possible. It also contains vital information for those responsible for commissioning and designing both services and professional training, as well as for journalists and policy-makers. We hope that it will help to change the way that we as a society think about not only psychosis but also the other kinds of distress that are

sometimes called mental illness. This report was written by a working party mainly comprised of clinical psychologists drawn from the NHS and universities, and brought together by their professional body, the British Psychological Society Division of Clinical Psychology. This report draws on and updates an earlier one, Recent Advances in Understanding Mental Illness and Psychotic Experiences, which was published in 2000 and was widely read and cited. The contributors are leading experts and researchers in the field; a full listing with affiliations is given at the end of the report. More than a quarter of the contributors are experts by experience - people who have themselves heard voices, experienced paranoia or received diagnoses such as psychosis or schizophrenia. At the end of the report there is an extensive list of websites, books and other resources that readers might find useful, together with list of the academic research and other literature that the report draws on.

Waking and the Reticular Activating System in Health and Disease provides a comprehensive overview on the activating properties of the RAS. In health, the RAS provides the basis against which we assess the external world, and in disease it distorts that world and shatters our self-image. This book describes the physiology of each process, how it is disturbed in each disorder, and what the most appropriate treatment should be. Dr. Garcia-Rill, along with contributions from leading specialists, discusses the understanding of the RAS as a system not only modulating waking, but also in charge of survival mechanisms such as fight vs flight responses and reflexes. The full spectrum of these functions helps explain the complexity of symptoms evident in such disorders as disparate as schizophrenia and Parkinson's disease. The book reviews the mechanisms that control waking and arousal, and especially how those mechanisms malfunction in certain neurological and psychiatric disorders. First comprehensive overview on the RAS and its role in schizophrenia, major depression, autism, Parkinson's, Alzheimer's, and other neurologic and mental diseases Offers a new way of thinking about brain function and the role of the RAS in our waking lives Written by a leading translational neuroscience researcher with contributions by specialists in the field

This is a new edition of the first comprehensive text to show how the advances in molecular and cellular biology and in the basic neurosciences have brought the revolution in molecular medicine to the field of psychiatry. The book begins with a review of basic neuroscience and methods for studying neurobiology in human patients then proceeds to discussions of all major psychiatric syndromes with respect to knowledge of their etiology, pathophysiology, and treatment. Emphasis is placed on synthesizing information across numerous levels of analysis, including molecular biology and genetics, cellular physiology, neuroanatomy, neuropharmacology, and behavior, and in translating information from the basic laboratory to the clinical laboratory and finally to clinical treatment. Editors Dennis Charney and Eric Nestle, along with their six section editors and over 150 contributors, have revised and updated all 80 chapters from the previous edition and have added new chapters on topics relating to, for example, genetics, experimental therapeutics, and late-life mood disorders.
